# PAVEMENT CYCLE

# Road CONSTRUCTION Set Up

**Temporary Structure  
Mobilized for Short duration and  
Ceased to exist once mission is over**

# ROAD Construction ENVIRONMENT

**01** Places of works are spread out

**02** Investments involved are large and decisions may involve risks

**03** Engineering failures due to ill defined scope of work , inadequate field investigations

# Balancing Production in ROUGH situations

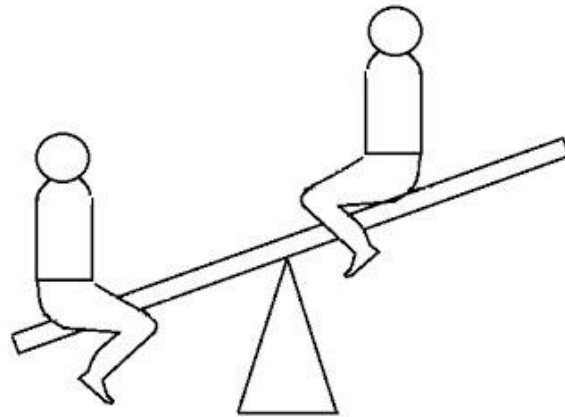

Materials

Hot mix plant

Transportation

Paving

Compaction

# PAVEMENT LAYERS

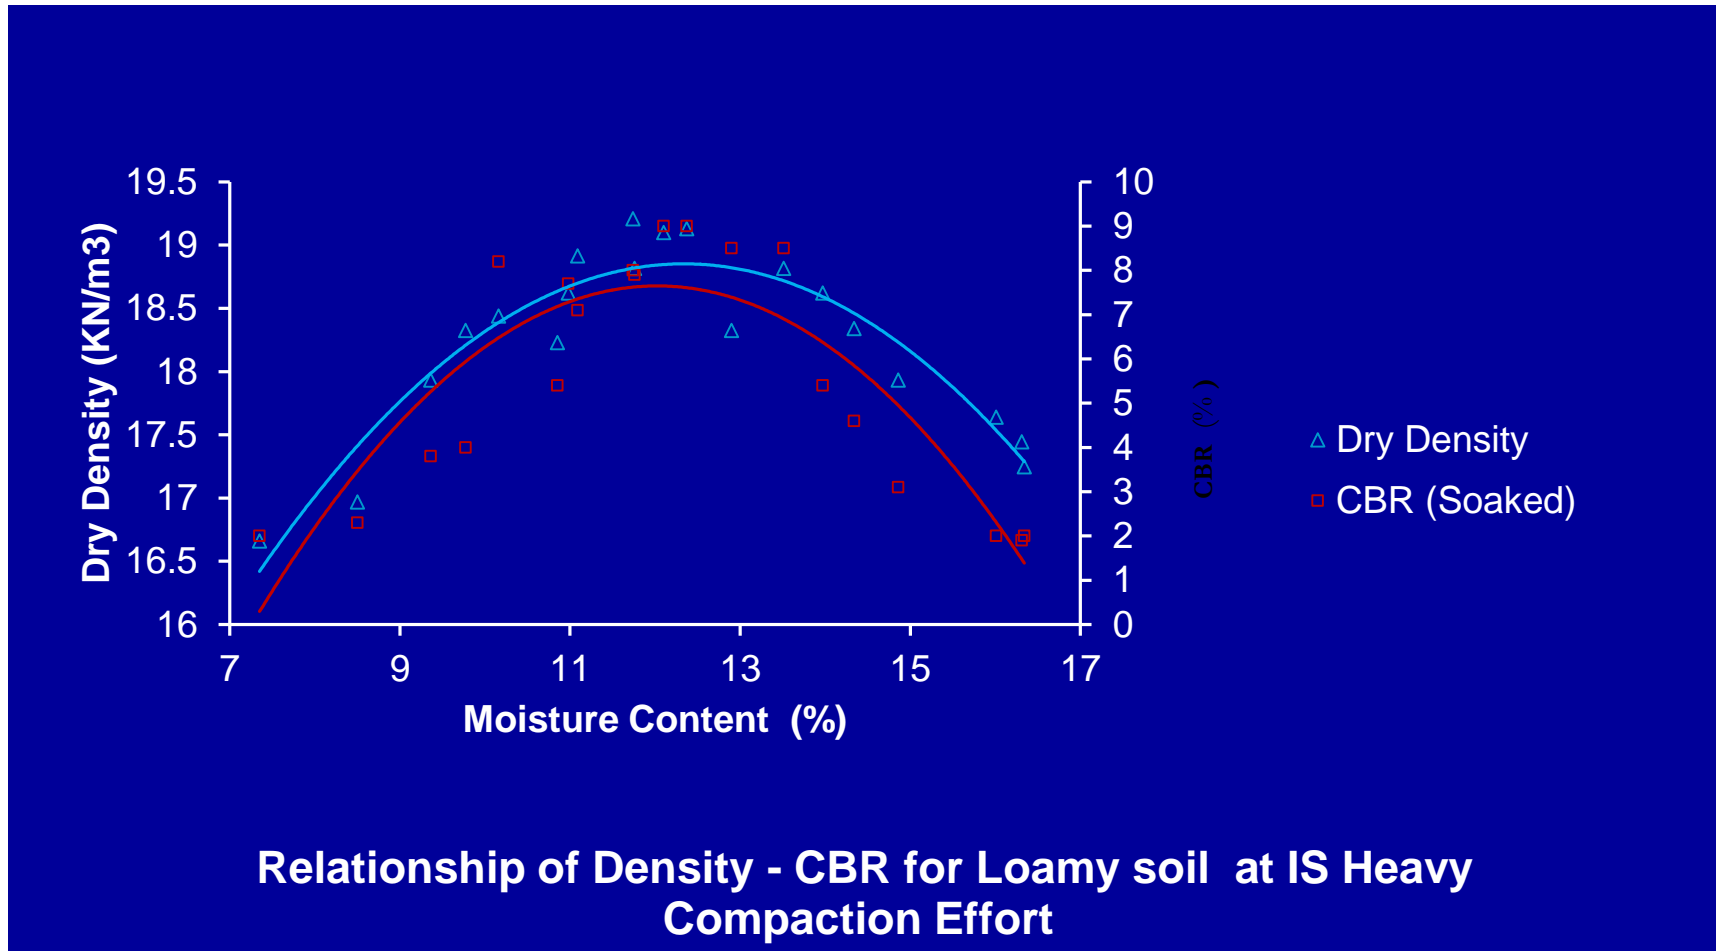

# CONSTRUCTION OF EMBANKMENT / SUBGRADE

## Density requirements of the embankment and subgrade materials (As per MoRTH Table 300-1)

| Type of work  | Maximum laboratory dry unit weight tested as per IS 2720 – part 8 |
|---|---|
| Embankments up to 3 m height, not subjected to extensive flooding                                     | Not less than 15.2 kN/cu.m  |
| Embankments exceeding 3 m height or embankments of any height subjected to long periods of inundation | Not less than 16 kN/cu.m  |
| Subgrades/earthen shoulders/verges / backfills  | Not less than 17.5 kN/cu.m  |

For same soil, using same compacting equipment higher density can be achieved , hence higher CBR

# SOIL LAYERS

**01** Uniform thickness, Density

**02** Maximum compacted thickness 250 mm,

**03** Lower side of OMC needs more compaction effort

,

## SOIL LAYERS

**04 Water consumption > 1 lakh litres / kilometre / lane**

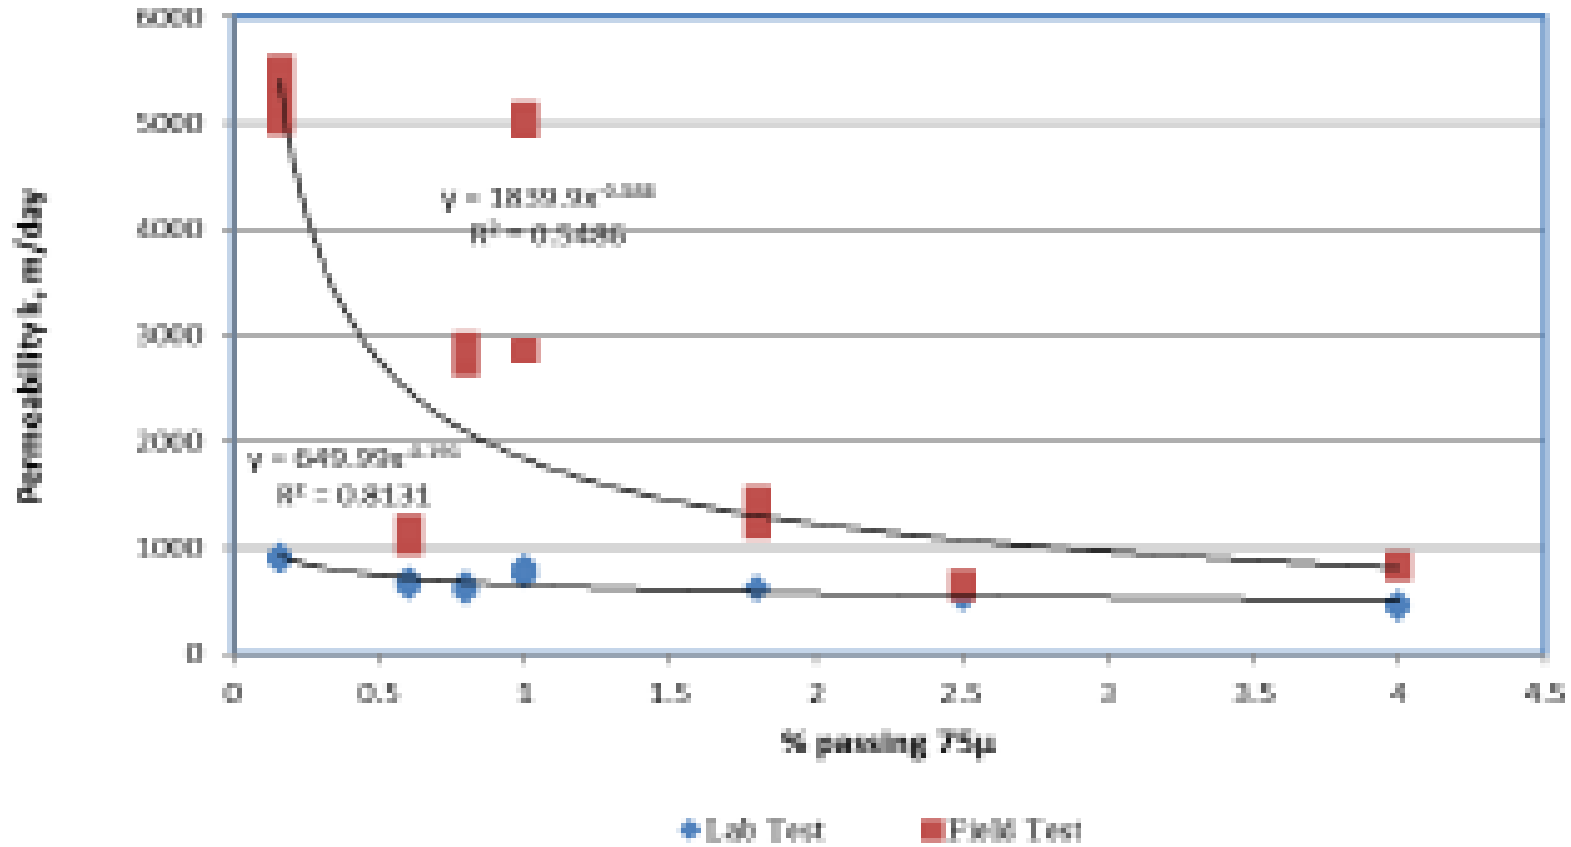

**05 Most precious construction material – WATER**

# PERMEABILITY - Granular Sub Base Layers

| Grades       | i =0.025                     | 0.035 | 0.04 |

# BITUMINOUS LAYERS

1

Overheating

wastage of water, power, and disinfectants used in treating water to prevent contamination

Heating for longer duration

through the reduction of pumping and treatment costs of the precious resource

2

3

Improper gradation

by limiting the possibility of crossed connections or infiltration of sewage

Exposure of DBM for heavy axles and rains for longer durations

when leakage volumes are recovered through the sewerage system

4

5

Stop and Go Paving

High VPM & Compaction at low temperature compaction

6

| Grading              | DBM – Grade I | DBM – Grade 2 | BC – Grade 1 | BC – Grade 2 |
|----------------------|---------------|---------------|--------------|--------------|
| Nominal Size (mm)    | 40            | 25            | 19           | 13           |
| Layer Thickness (mm) | 80-100 mm     | 50-75 mm      | 50-65        | 30-45        |
| Sieve Size (mm)      | % Passing     |               |              |              |

## Permissible Variations by Job Mix Formula

| Description                 | Permissible Variation |                |
|-----------------------------|-----------------------|----------------|
|                             | Base / Binder course  | Wearing Course |
| Passing 19 mm / larger      | +/- 8 %               | +/- 7%         |
| Passing 13.2 mm, 9.5 mm     | +/- 7%                | +/- 6%         |
| Passing 4.75%               | +/- 6%                | +/- 5%         |
| Passing 2.36, 1.18 & 0.6 mm | +/- 5 %               | +/- 4%         |
| Passing 0.3 mm & 0.15 mm    | +/- 4%                | +/- 3%         |
| Passing 0.075 mm            | +/- 2%                | +/- 1.5%       |
| Binder content %            | 0.3%                  | 0.3%           |
| Mixing temperature          | +/- 10 Deg            | +/- 10 Deg     |

# Segregation

## Mechanical Segregation

When large stones separate  
From smaller stones and fines

## Temperature Segregation

When there is a temperature  
differential behind the screed

# Segregation at Plant

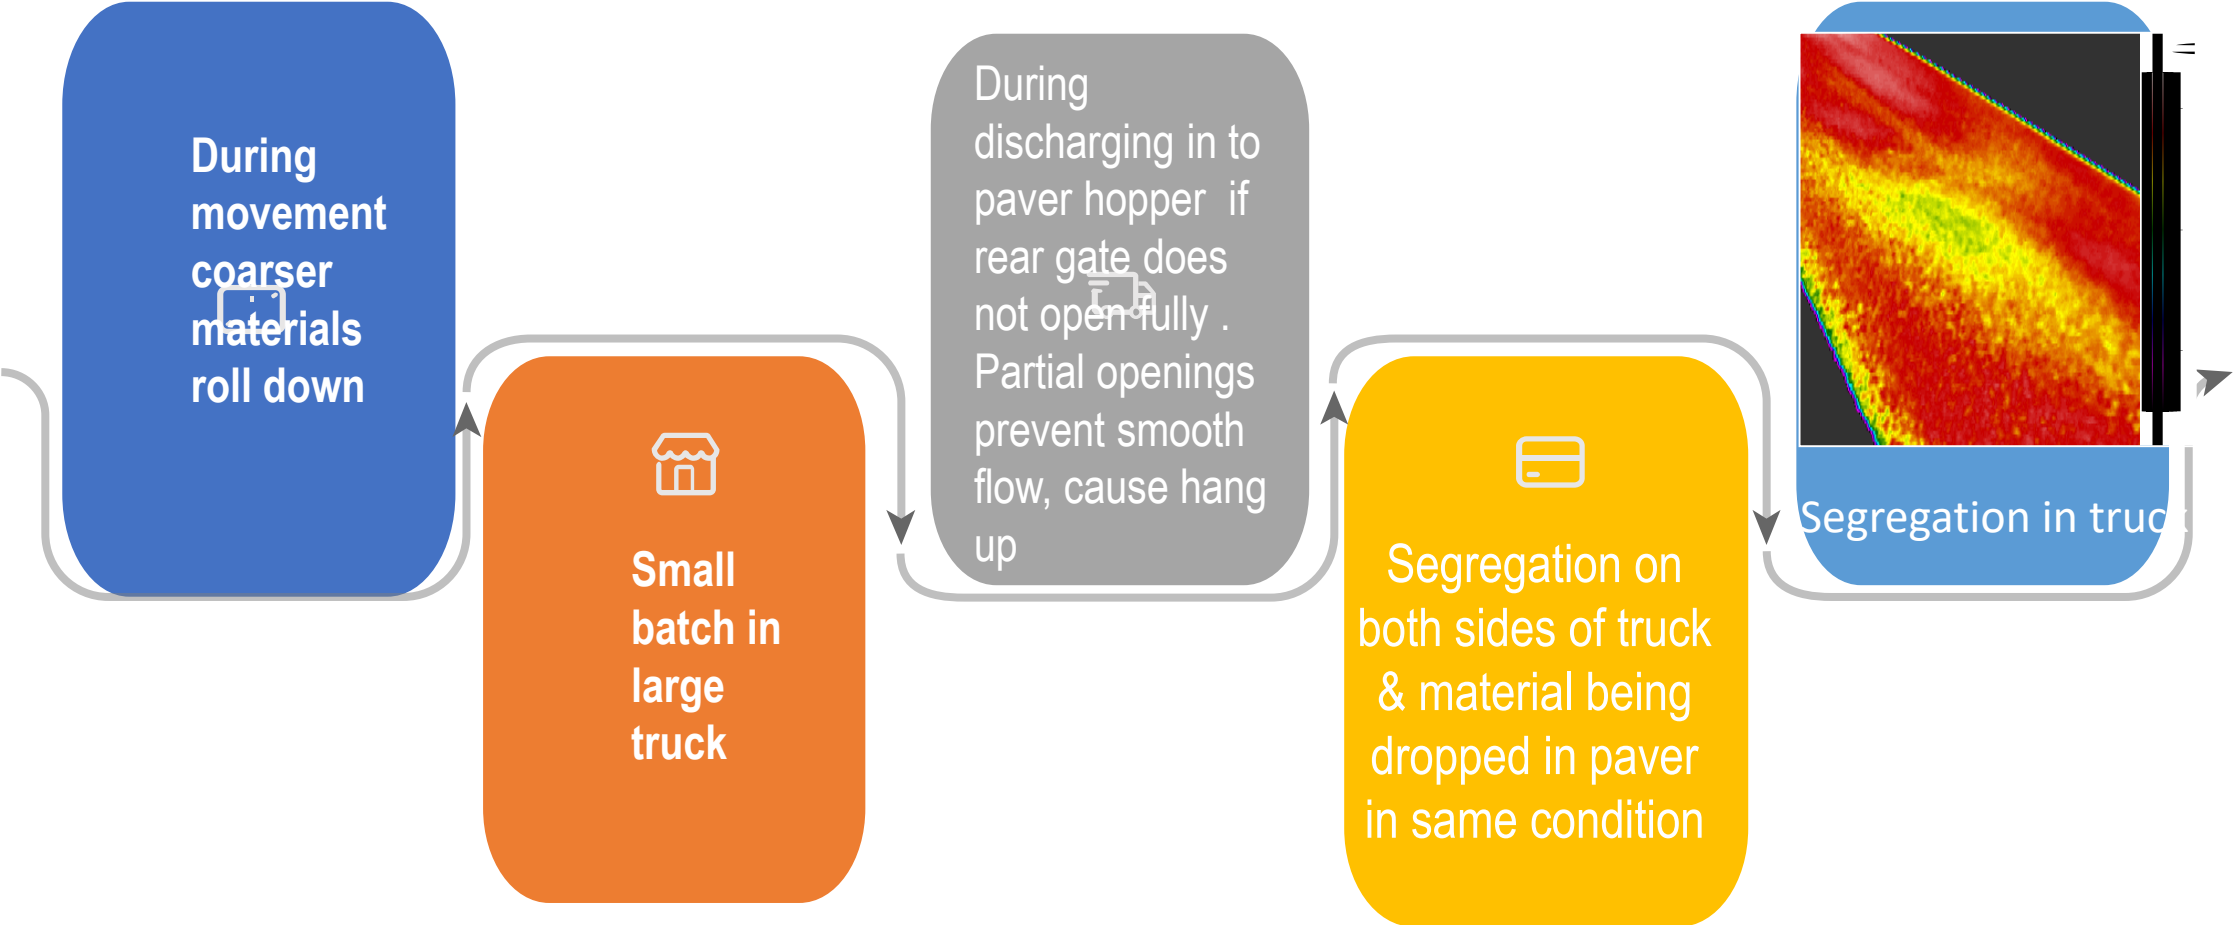

- Hang –up of feeder bins ( moisture)
- Inadequate mixing time in pug mill
- Lack of replacement of broken/ twisted/ ineffective paddles
- Level of material in pug mil
- Mix in motion ( free fall to hopper / truck)

- **Segregation in Transport**

- During movement coarser materials roll down
- Small batch in large truck
- During discharging in to paver hopper if rear gate does not open fully . Partial openings prevent smooth flow, cause hang up
- Segregation on both sides of truck & material being dropped in paver in same condition

# Segregation in Transport

## Segregation in Paver Finisher

- Insufficient material in hopper
- Material above the level of auger
- Coarser mixes / lean mixes are more prone to segregation

Courtesy: Volvo

Stop the truck short of the paver & let the paver make contact with the truck. Never allow the truck to back into the paver!

F1 Angle of attack

F2 Head of material

F3 Paving speed

F4 Tamper bar

F5 Vibration

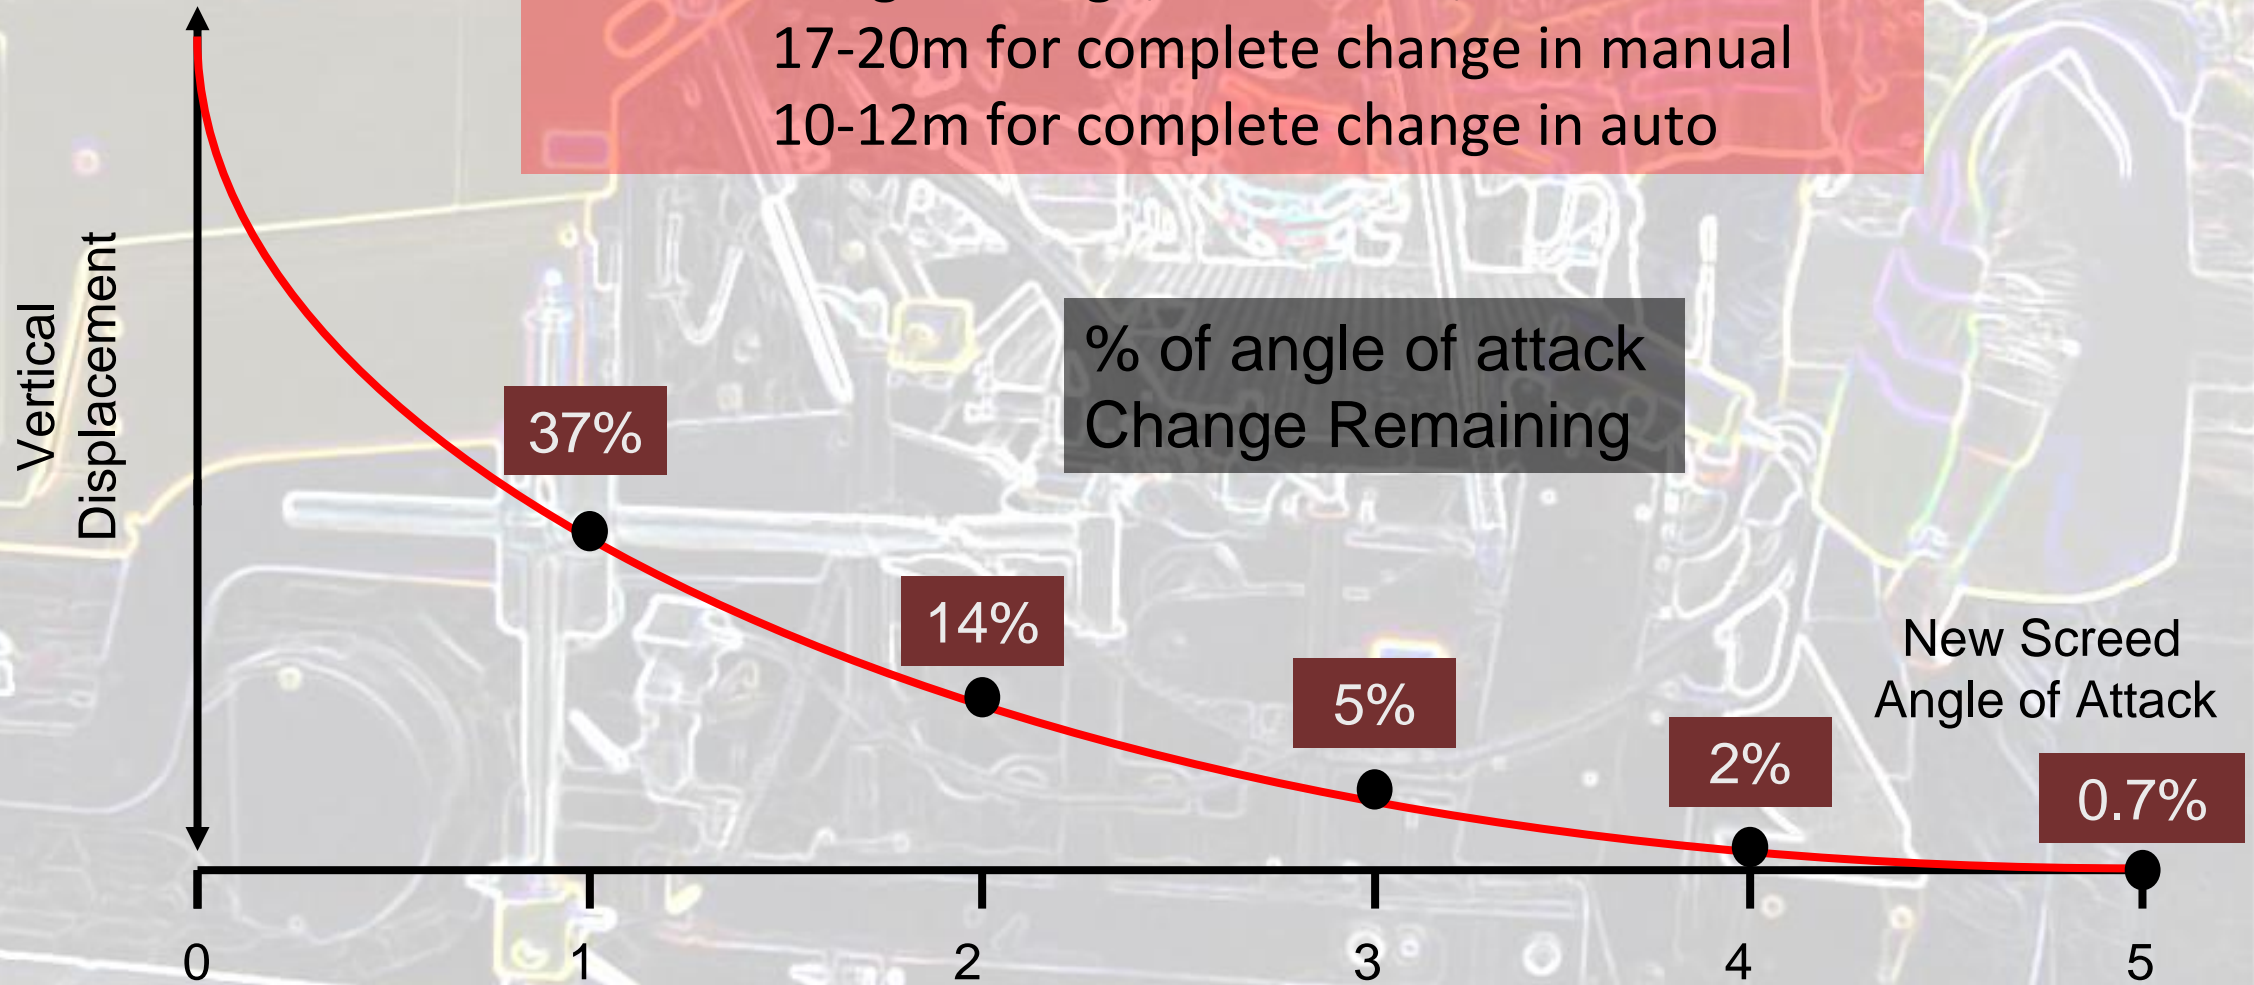

F6 Screed weight

F7 Material stability

# Changing Angle of Attack

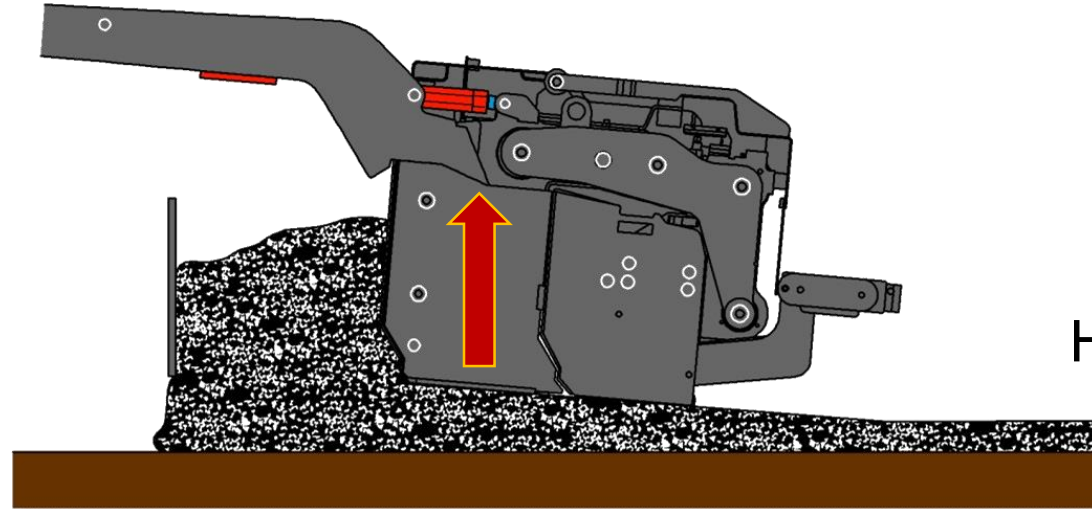

Change Screenshot  
Angle of Attack

When making a change, remember, it will take:  
17-20m for complete change in manual  
10-12m for complete change in auto

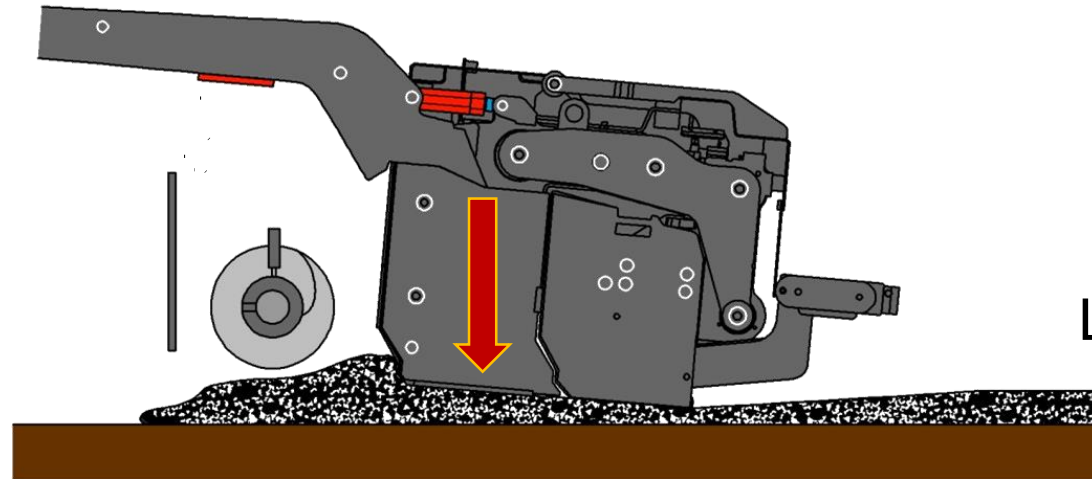

It takes 5 tow lengths for the change to be completed

Head of material  
volume too high

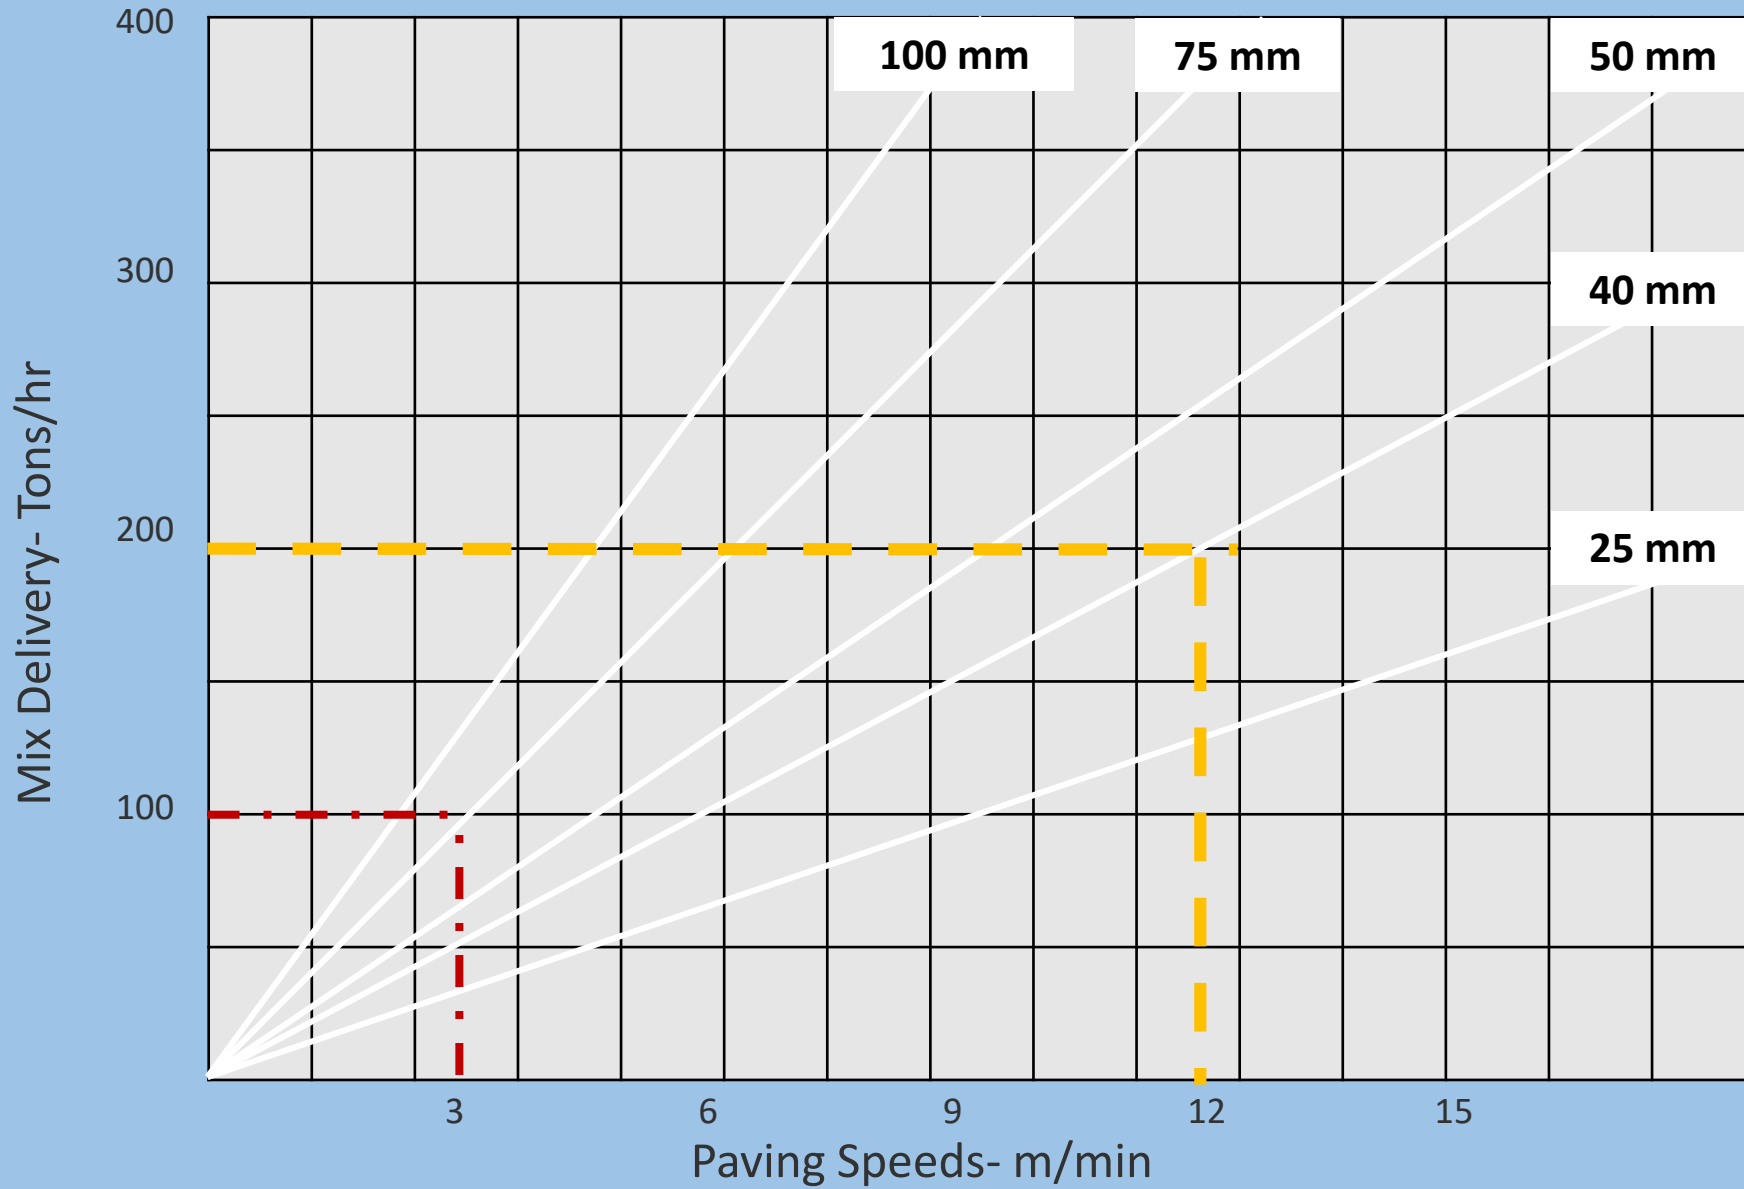

Screed rises  
Higher load on screed

Head of material  
volume too low

Screed Settles  
Lower load on screed

Paving Details  
 3.7m wide  
 2400kg/m<sup>3</sup>

# COMPACTION

- Improve Stability
- Improve Resistance to Permanent Deformation
- Improve Fatigue Resistance
- Reduce Low-Temperature Cracking Potential
- Reduce Moisture Penetration

# TYPES OF ROLLERS

- Static Steel Wheel
  - Kneading
  - Vibratory
  - Impact Rollers
- 
- SOIL COMPACTORS - one Steel drum
  - ASPHALT COMPACTORS – Steel drum both front and back
  - PNEUMATIC TYRED COMPACTORS

# PNEUMATIC TIRED ROLLERS

- Wheel load
- Inflation pressure
- Contact area

## Drum - Vibratory roller

Compacted high spots

Uncompacted low spots

Courtesy: Volvo

# LIGHT COMPACTING EQUIPMENT

**Constraint areas**

**Backfills**

**Maintenance / Pothole Patching**

# CONSTRUCTION OF JOINTS

- **Transverse joint**

- Preferably Vertical Joint
- Staggering of joints at least by 2 meters
- Spraying of bitumen on face
- Heating of Screed

- **Longitudinal Joint**

- Not be located on same line
- At 150 mm offset
- Vertical face
- Overlap of 25 to 50 mm with previously laid surface

## ROLLING SEQUENCE

- Transverse Joint
- Longitudinal Joint
  - Overlap of 150-175 mm
- Lower to Higher edge

## ROLLING OPERATION

- Break down rolling
- Intermediate Rolling
- Finish Rolling

# BREAKDOWN ROLLING

- Use smooth wheel rollers/ Static passes
- **Breakdown rolling must achieve majority of required compaction**
- An ineffective first pass may make final pass difficult to achieve
- There should not be any horizontal movement of mix

- When movement of mix is observed allow the mix to cool ( break down temperature)
- **Compaction helps in retaining the heat**
- Rolling zone at 50 m

## INTERMEDIATE ROLLING

- After breakdown rolling when mix still in plastic state  
Pneumatic rollers more suitable
- Pneumatic rollers may not increase the density substantially
- It does increase the stability of mix by kneading and reorientation of particles
- Sealing of layer ( tire pressure 0.7 to 0.9 MPa)

## FINISH ROLLING

- Carried out while material still in warm condition
- For removal of tire marks

# PRECAUTIONS FOR ROLLING

- Uniform speed
- Never allow compactor to stand
- Jerky start , sudden braking, sharp changes not to be made
- Change of lane to made only on already compacted surface
- Steel wheels / pneumatic wheels cause loss of heat
- Small amount of detergent / Vegetable oil
- Performance Chart of the equipments for our construction conditions

# HIGH EMBANKMENT

# PAVEMENT LAYERS

**BITUMINOUS BINDER & SURFACE COURSE**

1. About 10 lakh cum aggregates for every 100 km four laning

2. 2000 cum /lane/km – New construction

3. 175 cum /km/lane for every 5 years Overlay

4. 2 crore cum for every five years for road network

5. 20 lakh cum of soil for every 100 km new construction

# ROAD CONSTRUCTION COST BREAK UP

OPTIMIZATION

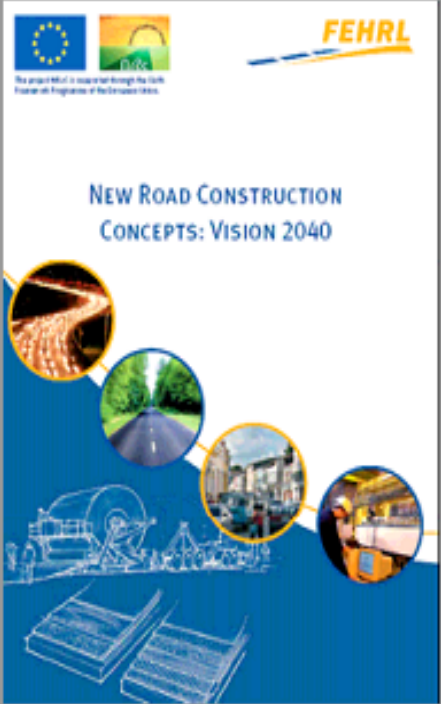

SMALL SAVINGS IN HUGE MONEY

UTILIZATION < 50% ,

Eg.           Crusher :           200 TPH  
              Pugmill: 100 TPH  
              HMP:       200 TPH  
              Paver :           500 TPH  
              Compactor :       500 TPH

utilisation factors: **0.5**

# VISION 2040

| Vision 2040   | Characteristics                                     | Construction Concepts                | Directions for solutions  |
|---|---|--------------------------------------|---|
|  <p>NEW ROAD CONSTRUCTION<br/>CONCEPTS: VISION 2040</p> | Available<br>Durable<br>Reliable                    | <b>Reliable Infrastructure</b>       | <ul style="list-style-type: none"> <li>• Lifetime engineering</li> <li>• Fast, hindrance-free maintenance</li> <li>• Balancing demand and capacity</li> <li>• Asset management tools</li> </ul> |
|   | Energy efficient<br>Sustainable<br>Environment      | <b>Green Infrastructure</b>          | <ul style="list-style-type: none"> <li>• Saving natural resources</li> <li>• Emission Control</li> </ul>  |
|   | Accessible<br>Smart<br>Safe                         | <b>Safe&amp;Smart Infrastructure</b> | <ul style="list-style-type: none"> <li>• Safe design</li> <li>• Smart design</li> <li>• Smart communication</li> <li>• Smart monitoring</li> </ul>  |
|   | Multi-functional<br>Multi usable<br>Public security | <b>Human Infrastructure</b>          | <ul style="list-style-type: none"> <li>• Public security</li> <li>• Multi-functional use</li> <li>• Human design</li> </ul>   |

## THANKS ARE DUE TO

- **BANGALORE INSTITUTE OF TECHNOLOGY, BENGALURU**

Prof. Poornachandra Tejaswi

Prof. HB Balakrishna, HoD – Civil

Prof. MU Aswath, Principal

- **INDIAN CONCRETE INSTITUTE – BENGALURU CHAPTER**

Dr. LR Manjunath, Chairman

Dr. RL Ramesh, Secretary

**THANK YOU FOR KIND  
ATTENTION**
